

A quick guide to establishing and operating a marine farm in New Zealand

This guide has been developed by the New Zealand government to help marine farmers know where to go for various aspects of setting up and operating their marine farm.

This guide is meant to provide general information only and does not constitute legal advice. If you are serious about setting up a marine farm we recommend you still contact the appropriate regional council and central government agencies for help.

How do I set up a new marine farm?

Establishing a marine farm under the Resource Management Act (RMA) 1991 involves ensuring the marine farm is located within an Aquaculture Management Area (AMA) that is provided for under a regional coastal plan, gaining an authorisation where necessary to apply for a resource consent, and obtaining a resource consent. You will also need to register your marine farm with the Ministry of Fisheries' Fish Farming Register.

The AMA process

The RMA aims to promote the sustainable management of the natural and physical resources of our environment. Under the Act, New Zealand's regional councils and unitary authorities are responsible for managing marine farms within their coastal marine area – the zone between the line of the highest tide water mark and the 12 nautical-mile limit.

The RMA provides for council (including the new Invited Private Plan Change option) and privately initiated AMAs. Your regional council or unitary authority (hyperlink to list at end of document) should be your first port of call to find out more about coastal planning and AMA planning processes in your area.

Additionally, there are a number of resources available to help you learn more about the RMA, coastal planning and AMAs. Two resources that may be of particular interest are a web-based gateway to information about the Resource Management Act 1991 (hyperlink to www.mfe.govt.nz/rma/index.php) and Aquaculture Reform 2004: The Rules of the Game – Creating Aquaculture Management Areas (hyperlink to <http://www.mfe.govt.nz/publications/rma/aquaculture-info-game-rules-jan05/>).

Resource consent process

The resource consent process is relevant if you have access to an existing AMA or expect to in the near future. You will need to contact your regional council or unitary authority to apply for a resource consent. As part of the process, you will need to find out from your council what type of consultation is appropriate, what information will be required, and what application forms you will need to complete.

It is important for applicants to work with any affected parties as soon as possible. This important step may save you time and money. Affected parties could include: local iwi, neighbours, interest groups (e.g. environmental groups, boating clubs,

commercial or recreational fishers), the Department of Conservation, along with regional, district, or city councils.

All leases and licences granted under the Marine Farming Act are in effect until 2025, at which time they will need to be reapplied for. Marine farms that have been granted coastal permits and marine farming permits have specific expiration dates.

Fish Farmer Registration

Everyone carrying out the activity of fish farming must be registered on the Fish Farmer Register. The register is managed by FishServe, on behalf of the Ministry of Fisheries.

After a regional council has issued a consent or a consent variation, an application for registration or a variation of a fish farmer's registration must be completed by the person carrying out the activity of fish farming and returned to FishServe. An application for registration or a variation of a fish farmer's registration can be obtained at FishServe at www.fishserve.co.nz or (04) 460 9555.

An application must also be completed when the following changes are made to your registration:

- (a) Changes in the number of sites farmed (e.g. have you commenced farming on a site not currently noted on the register against your name).
- (b) Changes in the number of sites farmed (e.g. have you ceased farming on a site currently noted on the register against your name).
- (c) Changes in the species authorised to be farmed on the site. (e.g. has there been a change in the species listed on the resource consent changed).
- (d) Changes in the area farmed on a site (e.g. for those persons who farm part of the area covered by the resource consent).
- (e) The consent covering a site is renewed.

Also, each year FishServe will send out to each registered fish farmer an annual update form that is required to be completed and returned as soon as possible.

A copy of the Fish Farmer Register can be obtained from FishServe.

In general, along with the application you will also need to supply the following when registering:

- A copy of the resource consent or certificate of compliance issued under the RMA that relates to the site and/or the species applied for in the application.
- If the consent is not in the name of the applicant, proof that the applicant has the consent of the consent holder.

What role does the Maori Commercial Aquaculture Settlement play in establishing new marine farms?

The Maori Commercial Aquaculture Claims Settlement Act 2004 can provide iwi with access to aquaculture space to develop their marine farming interest.

The settlement requires the government to provide Iwi Aquaculture Organisations (IAOs) with 20 per cent of all new aquaculture space.¹ This means that where Aquaculture Management Areas (AMAs) are created, 20 per cent of the new space will be allocated to IAOs.

The government is also required to provide IAOs with the equivalent of 20 per cent of space created between 21 September 1992 and 31 December 2004, this is known as the pre-commencement space component.

Aquaculture space provided to IAO under the Maori Commercial Aquaculture Claims Settlement Act is through the Maori Commercial Aquaculture Settlement Trust (the Takutai Trust), which was established under the Act and is managed by Te Ohu Kaimoana Trustee Limited. The 20 per cent Māori component of any AMA is provided to the Takutai Trust and then allocated to IAOs.

Allocation is done on a region-by-region basis, and is based around the jurisdictions of Regional Councils and Unitary Authorities as well as by the harbours that have been identified by the second schedule of the Maori Commercial Aquaculture Claims Settlement Act.

The government is committed to enabling the settlement and is actively working towards this with Te Ohu Kaimoana, IAO, local government and the industry. To learn more view the Ministry for the Environment's fact sheet on Aquaculture reform 2004 – Settling Māori Claims. (hyperlink to <http://www.mfe.govt.nz/publications/rma/aquaculture-info-maori-claims-jan05/>)

To find out more about the Maori Commercial Aquaculture Claims Settlement Act contact Raina Meha, Senior Policy Analyst for Aquaculture, Te Ohu Kaimoana at mehar@teohu.maori.nz or by calling 04 931 9500.

Are there any rules when setting up structures for a marine farm?

Just like any other business, you will need to ensure that you are complying with all codes and regulations when building new structures or modifying existing structures on your marine farm.

Navigation

All marine farming vessels need to be in the Safe Ship Management System which is administered by Maritime New Zealand. The system makes ship owners and operators responsible for the daily safe operation for their vessels. Information about the system is available on the Maritime New Zealand website (hyperlink to http://www.maritimenz.govt.nz/SSM/ssm_intro.asp).

Maritime New Zealand has developed guidelines for the aquaculture industry and consent authorities on navigation-related matters. These guidelines cover the lighting

¹ An IAO is the same mandated iwi organisation established under the Maori Fisheries Act 2004 and must also have been authorised by their iwi members to receive aquaculture settlement assets under the Aquaculture Settlement.

and marking of marine farm structures in designated aquaculture management areas. The guide is available on Maritime New Zealand's website (hyperlink to http://www.maritimenz.govt.nz/port_harbour/pandh_docs/Guideline-for-Aquaculture-Management-areas-and-Marine-Farms.pdf).

Your regional council or unitary authority is responsible for ensuring that existing and new aquaculture management area locations do not become navigational hazards. Councils will monitor farms for ongoing compliance with navigational safety requirements.

Complying with the Building Act 2004

Many marine farm structures fall under the jurisdiction of the Building Act 2004. Local authorities implement many of the functions under the Act, including issuing building consents.

Aside from onshore facilities, such as warehouses, processing plants, equipment stores, workshops, living quarters, and offices, there are also some structures in the water that may need to comply with the Building Act and Building Code. For example, on some finfish farms, the structures in the water may include living quarters.

You can learn more about the Building Act, the Building Code, and related information at the Department of Building and Housing's website (hyperlink to <http://www.dbh.govt.nz/blc-building-act>).

What food safety regulations are in place for aquaculture products?

All commercially produced food products must comply with New Zealand's food safety legislation and if being exported, with any overseas requirements for processing, packing, and labelling.

Finfish and bivalve shellfish have slightly different food safety requirements. This is due to the specialised filter-feeding systems of bivalve species (mussels, oysters, and clams) which enables them to concentrate any microbial, chemical or marine biotoxin contaminants present in the water. Shellfish are eaten without removing the gut and often in a raw state so the food regulations require that they only be commercially harvested from safe waters.

New Zealand's current government policy is "user pays". This means that any costs incurred when registering the farms with the government agencies and the associated food safety requirements must be paid for in full by the farmer.

Shellfish

New Zealand's mandatory shellfish food safety programme is based on the international best practice but has been adapted to take account of our unique environment and aquaculture practices.

The programme is managed by the New Zealand Food Safety Authority (NZFSA) with the cooperation of their public health agents in District Health Boards and the shellfish industry.

For full details of this programme, refer to the Animal Products (Regulated Control Scheme – Bivalve Molluscan Shellfish) Regulations 2006 (hyperlink to <http://www.nzfsa.govt.nz/animalproducts/legislation/regulations/index.htm>) and the Animal Products (Specifications for Bivalve Molluscan Shellfish) Notice 2006 (hyperlink to http://www.nzfsa.govt.nz/animalproducts/legislation/notices/animal-material-product/shellfish/bmsrresspecv-16_2_signed.pdf).

The programme requires that all farms are registered and classified using a system which assesses the public health risk of pollution from humans, animals, and birds. Areas that are likely to have high pollution problems are classified as “Prohibited”.

Most areas in New Zealand are classified as “Conditionally Approved”. This means that they can be harvested safely at most times, but there are short time closures after environmental events that will cause low-level pollution. Rainfall is one such condition, as it usually means land run-off, therefore each area will have a site specific criterion which closes the farms for a few days after rainfall events so allowing the shellfish to purge any pollution.

Once an area is classified and registered by NZFSA, there are regular monitoring requirements to verify the safe environmental conditions. To accomplish this, samples of water and shellfish will be taken very regularly to check for microbial, chemical, phytoplankton, and marine biotoxin levels.

Finfish

As finfish do not pose the same level of food safety risk as shellfish, the regulatory requirements are a lot less. New Zealand has very good quality seawater in most areas for fish farming, which means farmers do not need to use pharmaceutical drugs to ensure healthy fish.

It is possible, however, that NZ FSA will require an occasional fish sample to be taken to test for heavy metals and other chemical residues to verify the growing conditions.

Processing seafood

Shellfish, finfish, and any other aquaculture products that may be commercially harvested for food (e.g. seaweed species) must be processed in a processing environment that meets the NZFSA’s strict hygiene standards. All processing operations must be registered and are regularly audited by NZFSA officials or their local agents in Territorial Authorities. Beyond this, companies should routinely take microbiological samples and are required to keep records of their quality assurance programmes.

Companies producing ready-to-eat products, such as smoked seafood, must also have microbiological programmes that monitor their premises and products for *Listeria monocytogenes*.

For more information

To learn more about New Zealand's overall food safety programme contact Phil Busby, Senior Programme Manager (Seafood), New Zealand Food Safety Authority, at 04 463 2500 or phil.busby@nzfsa.govt.nz. You may also want to contact your District Health Board Public Health Unit. (hyperlink to <http://www.nzfsa.govt.nz/processed-food-retail-sale/food-safety-coordinators.htm>)

For additional information on shellfish quality programmes contact the following industry representatives:

National: Dorothy-Jean McCoubrey, Aquaculture New Zealand, at 03 548 8944 or dj@aquaculture.org.nz

Marlborough region: Helen Smale, Manager, Marlborough Shellfish Quality Programme, at 03 578 5048 or msqp@xtra.co.nz

What if I have concerns about external sources of water pollution on my farm?

In some areas, water quality can be a real concern for marine farmers and pinpointing the exact cause of the pollution is often a challenge. Human-induced pollution can occur from land-based activities (e.g. agricultural run-off, accelerated erosion, urban stormwater run-off, and poorly maintained septic tanks) or from water-based activities (e.g. boating, swimming, oil spills). At other times water quality may be affected by natural occurrences (e.g. coastal upwellings, algal blooms, or bird droppings).

Regional councils and unitary authorities are also responsible for administering the Resource Management (Marine Pollution) Regulations 1998. The regulations include rules on dumping, incineration, and control of discharges from vessels. In 2002, an amendment to the regulations was passed to increase the protection for marine farms, customary fishing reserves, and marine reserves from sewage discharges from boats. The regulations now provide for two standards of treated sewage for boats Grade A and Grade B onboard sewage treatment systems.

If you have any concerns about water pollution or want to learn more about water quality programmes contact your regional council or unitary authority.

Marine oil spills

In terms of marine oil spills, New Zealand has adopted a three-tiered approach: 1) Individual sites and vessels from which a spill of oil is possible are responsible for responding to a spill on their site. 2) Regional councils, led by regional on-scene commanders trained by Maritime New Zealand, respond to marine oil spills within their regions that exceed the clean-up capability of Tier 1. 3) Maritime New Zealand manages the response, when, due to size, cost or environmental impact, responding to a spill exceeds the capacity of the resources available at both Tier 1 and Tier 2.

What about levies?

Under the Commodity Levies Act, all commercial growers of mussels, oysters and salmon pay a levy per tonne of product harvested. The Users Guide to the Commodities Levies Act can provide you with additional information. (hyperlink <http://www.maf.govt.nz/mafnet/rural-nz/profitability-and-economics/compliance-costs/commodity-levy-act-guide/httoc.htm>)

What are the national industry organisations in New Zealand?

Aquaculture New Zealand ([hyperlink to www.aquaculture.org.nz](http://www.aquaculture.org.nz)) is a levy-funded national organisation that provides a collective over-arching representation of the three primary species groups in the aquaculture industry (mussels, salmon and oysters). It is also responsible for meeting the vision and goals set out in the New Zealand Aquaculture Strategy.

The levy-funded New Zealand Seafood Industry Council Ltd ([hyperlink to www.seafood.co.nz](http://www.seafood.co.nz)) also represents the aquaculture industry at the national level. One role of the council's is providing programmes through the Seafood Industry Training Organisation (SITO) ([hyperlink to www.sito.co.nz](http://www.sito.co.nz)). SITO aims to ensure that both the aquaculture and fishing industry have available the skills and experience needed in order to compete internationally and meet consumer needs.

There are also a number of regional and species-specific organisations. To learn more, contact Aquaculture New Zealand at 03 548 8944 or the New Zealand Seafood Industry Council at 04 385 4005.

Codes of practice

Industry codes of practice have been adopted by salmon, mussel, and oyster farmers. Beyond that, Aquaculture New Zealand is working with key stakeholders, including NGOs, to establish a national environmental code of practice for the sector.
